Raspberry Pi USB Gadget Control Through MCP

Belcarra's [pigadget_mcp](https://github.com/Belcarra/pigadget_mcp) provides a Model Context Protocol (MCP) service for configuring and monitoring
Raspberry Pi USB gadgets remotely. Scripts and AI agents can select EEM, ECM, RNDIS or NCM, specify USB vendor and product IDs, configure static
IPv4 or DHCP addressing, and retrieve device identity and connection status. It supports repeatable driver and device testing, including software
disconnect/reconnect operations and cleanup after a test.

The service uses Belcarra's [gadgetconfig](https://github.com/Belcarra/gadgetconfig) tools to create and control Linux USB gadget configurations.
Install gadgetconfig on the Pi first, then run pigadget_mcp as a headless service, directly accessible to an MCP client or through an MCP broker o
n a trusted network. For interactive desktop use, gadgetconfig also includes the gadgetapp graphical interface.
